REST AVAILABLE COP

(54) Title: MANUFACTURING OF PHOTOCATALYTIC, ANTIBACTERIAL, SELPCLBANING AND OPTICALLY NON-IN-TERFERING SURFACES ON TILES AND GLAZED CERAMIC PRODUCTS

(57) Abstract: The principle of the deposition technique uses ultrafine crystals of ceramic oxides deposited relatively cold on melted or partially melted surfaces of ceramic tiles and other glazed ceramics, creating a spotty deposition without a significant change of or partially melted surface. Because the desired nano-substance is deposited cold in a solid state form on the hot "sticky" surfaces and rapidly cooled down, deposited material is directly melted into the substrate surface, but its outer side remains unchanged. It allows creating a deposition with the desired parameters, for amplifying and extending the antibacterial protection in the dark, these surfaces may contain noble and heavy metals, deposited either dry as a part of the powder, or in a separate step, directly on the surface by wet deposition followed by drying and calcination.
